Flight Status Tracker

Team Members

2520030083 – Saanvi

2520030487 – Sindhu

Under the guidance of

Dr. Lakshmi Prasanna

Term – 3 semester 2025-26

Project Requirements

1. Purpose

The purpose of the Flight Status Tracker is to provide users with real-time flight information, including flight schedules, departure and arrival timings, delays, cancellations, gate information, and flight status updates. The system helps travellers, airport staff, and airlines monitor flight movements efficiently.

2. Problem Statement

Passengers often face difficulties in obtaining accurate and timely flight information. Delays, gate changes, and cancellations may cause confusion and inconvenience. The Flight Status Tracker aims to provide a centralized platform that delivers up-to-date flight information quickly and accurately.

3. Goals

- Provide real-time flight status updates.
- Allow users to search flights using flight number.
- Display departure and arrival information.
- Show flight delays and cancellations.
- Improve passenger convenience and travel planning.
- Provide an easy-to-use interface for tracking flights.

4. Scope

In Scope

- Flight search by flight number.
- Display flight status (On Time, Delayed, Cancelled, Departed, Arrived).
- Show departure and arrival times.
- Display airline details.
- Real-time status updates.
- Responsive user interface.

Out of Scope

- Flight ticket booking.

- Online payment processing.
- Seat selection.
- Hotel reservations.
- Airport navigation services.

5. Users

Primary Users

- Passengers
- Travelers
- Airport Visitors

Secondary Users

- Airport Staff
- Airline Employees
- Travel Agencies

6. Functional Requirements

User Features

1. User can enter a flight number.
2. System validates the entered flight number.
3. System fetches flight details.
4. System displays:
 - Flight Number
 - Airline Name
 - Departure Airport
 - Arrival Airport
 - Departure Time
 - Arrival Time
 - Current Status
5. User can refresh flight information.
6. System updates status dynamically.

7. User can view delayed or cancelled flight information.
8. User can search multiple flights.

7. Non-Functional Requirements

Performance

- Flight details should load within 3 seconds.

Reliability

- System should provide accurate flight information.

Usability

- User-friendly interface.
- Easy navigation.

Scalability

- Support multiple users simultaneously.

Security

- Protect user search history.
- Secure API communication.

Availability

- System should be available 24/7.

8. Assumptions

- Users have an internet connection.
- Flight information APIs are available and functioning.
- Airlines provide accurate real-time data.
- Users enter valid flight numbers.
- Server infrastructure remains operational.

9. Acceptance Criteria

Search Functionality

- User can search using a flight number.

Flight Information Display

- Flight details are displayed correctly.

Real-Time Updates

- Status updates are reflected when data changes.

Delay/Cancellation Tracking

- Delayed and cancelled flights are shown accurately.

Performance

- Information loads within acceptable response time.

User Interface

- Application is responsive and easy to use on desktop and mobile devices.
